Research Interests

My primary research focuses on **AI for cybersecurity and threat intelligence**. I have developed **domain-specific generative models** that preserve structural properties downstream classifiers require, ranging from continuous physical signals in wireless communications to discrete TTP sequences in cyber threat analysis. I recently expanded this foundation to LLMs for cyber threat knowledge graph extraction, shifting my focus from synthetic data generation to automated intelligence extraction. To advance this trajectory, I intend to deploy **agentic AI systems** to automate complex security tasks and investigate their vulnerabilities, contributing to the field of **securing AI**.
